# 1. Introduction

## 1.1 Purpose

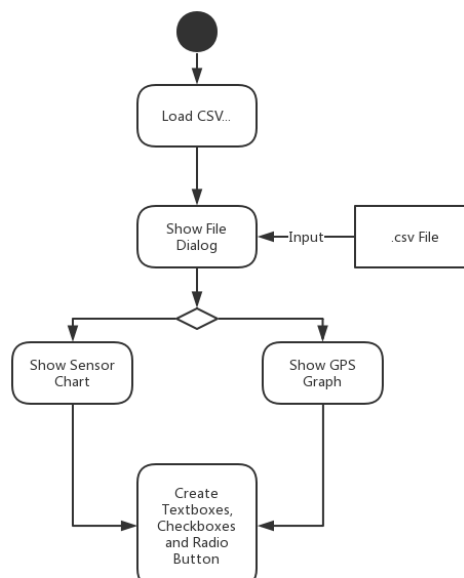

The Data-Graph Software is a PC based software developed to draw the graph which depicts different sensors for the racing car and show the GPS information. This instruction is for the software users and software tester.

## 1.2 Background

Racing car is one of the fiercest activities. It requires people to have access to different sensors in the car in order to evaluate the performance of the driver and train the driver by the feedback from the sensors. Our software is meant to help coach to transfer the data of different sensors to intuitive graphs easily.

# 2. Software overview

## 2.1 Load CSV Files

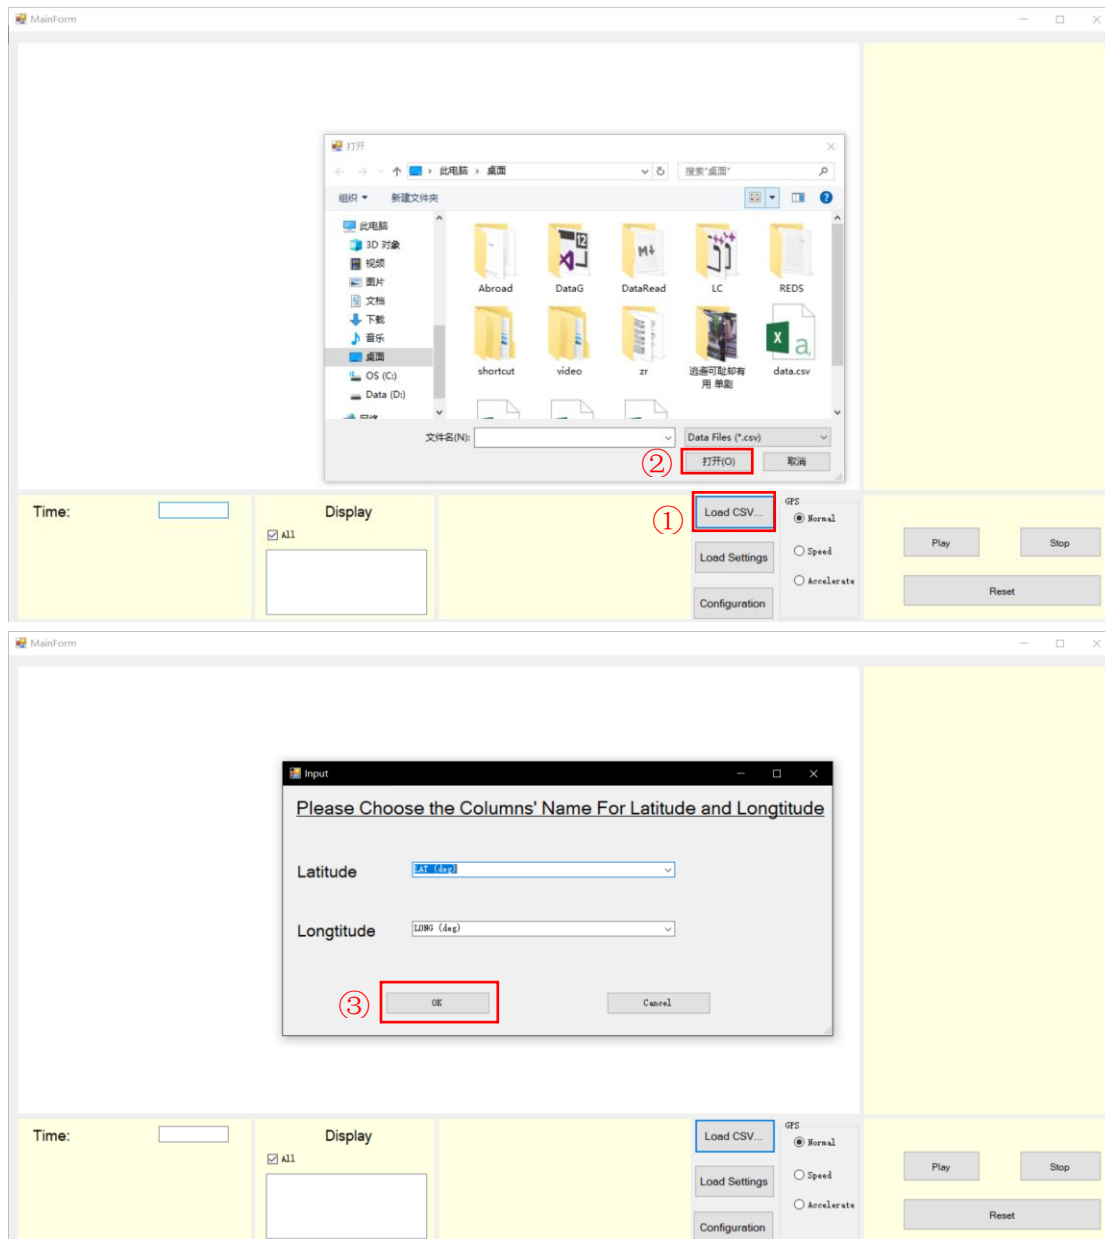

Call function of fileLoadingButton\_Click and pop up a file dialog for users to choose their CSV file. After users choose their files and the columns for latitude and longitude, the software could draw graphs for different series of sensors and the GPS graph for the route of driving. Also, the software would dynamic create textboxes,

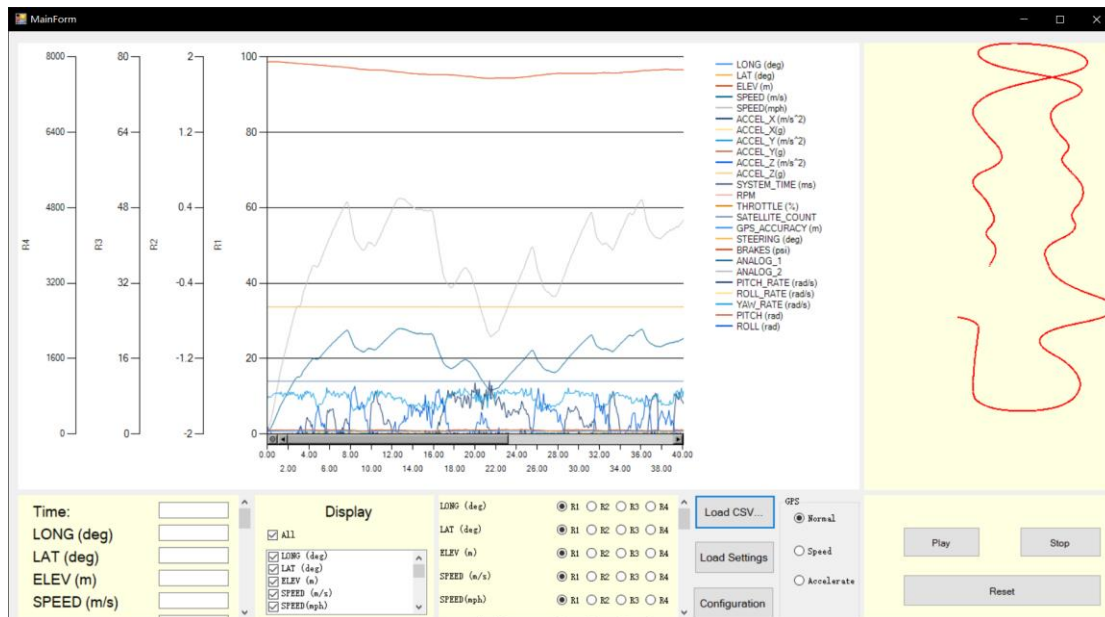

checkboxes and radio buttons for different sensors read from the CSV file.

Related Functions:

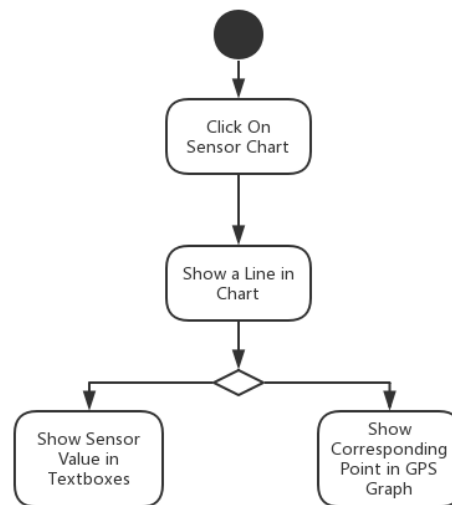

`void fileLoadingButton_Click(object sender, EventArgs e)`

`DataTable OpenCSV(string filePath)`

## 2.2 Show Specific Value of Points

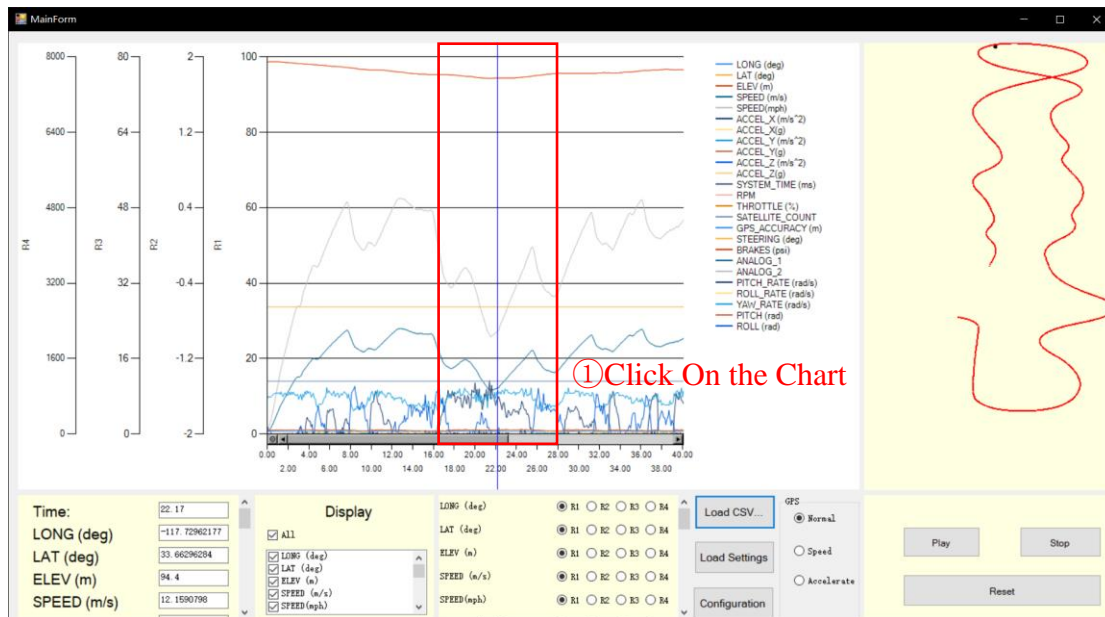

Users could click on the graph and show a vertical line at where the mouse clicked. Then the textboxes below would show the values of different sensors. Meanwhile, there would be a black point in the GPS graph to show the same place as you click on the chart.

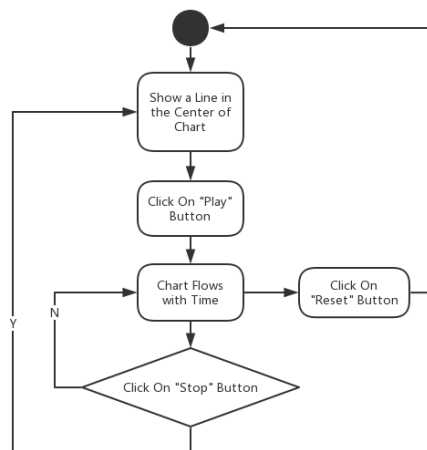

Related Functions:

```

void sensorChart_MouseClick(object sender, MouseEventArgs e)
int findLeftNear(double value, double[] array, int length)
  
```

## 2.3 Replay the Data

Users could click on “Play” button and call the function of buttonPlay\_Click. This function enables chartTimer so that it could repeatedly execute the function of chartTimer\_Tick at intervals. In the meantime, the textboxes below would show the values of sensors as the chart flowing. When users click on “Stop” button, the chart would stop flowing. After “Play” button is re-clicked, the chart would begin to flow from where it stops. The “Reset” button would let users to reset the chart to the original state.

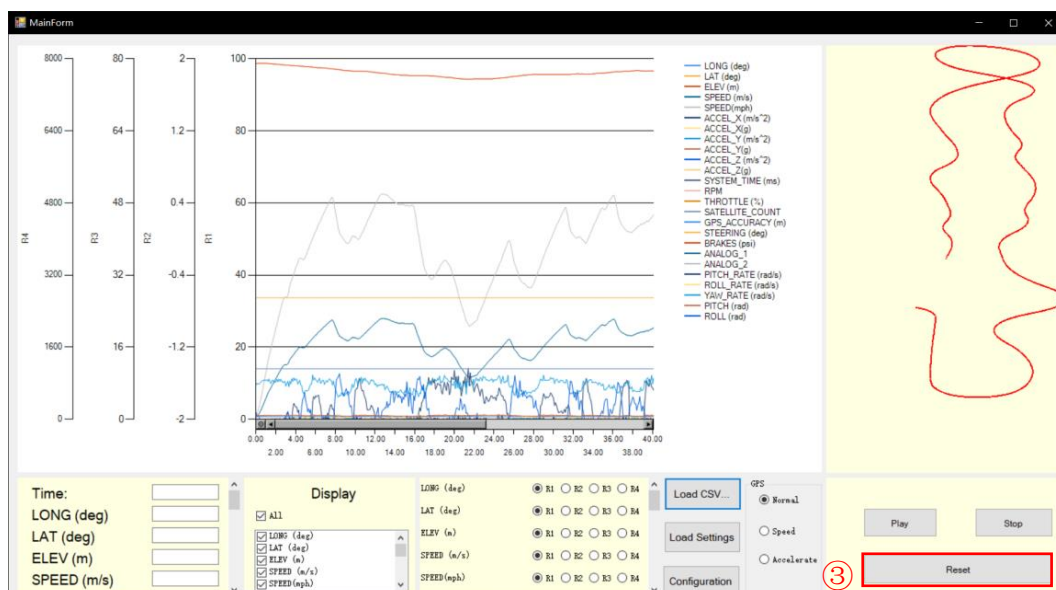

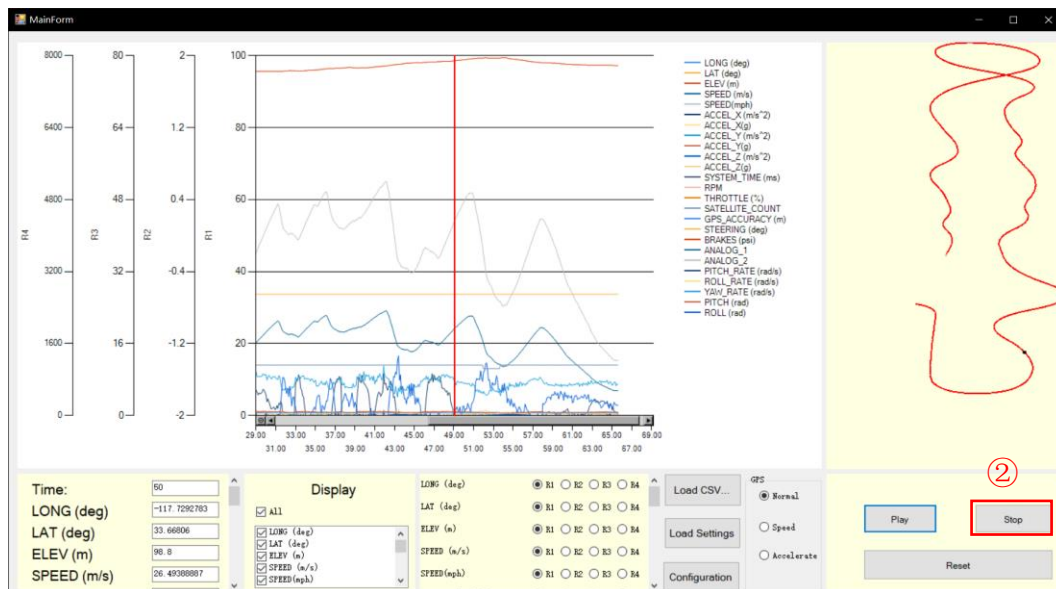

Related Functions:

`void buttonPlay_Click(object sender, EventArgs e)`

`void buttonStop_Click(object sender, EventArgs e)`

`void resetButton_Click(object sender, EventArgs e)`

`void chartTimer_Tick(object sender, EventArgs e)`

## 2.4 Choose Different Type of Y Axis

Users could change different series from one Y axis to another one. The software provides 4 different Y axes. We can switch between different axes by radio buttons dynamically created by fileLoadingButton\_Click function.

Related Functions:

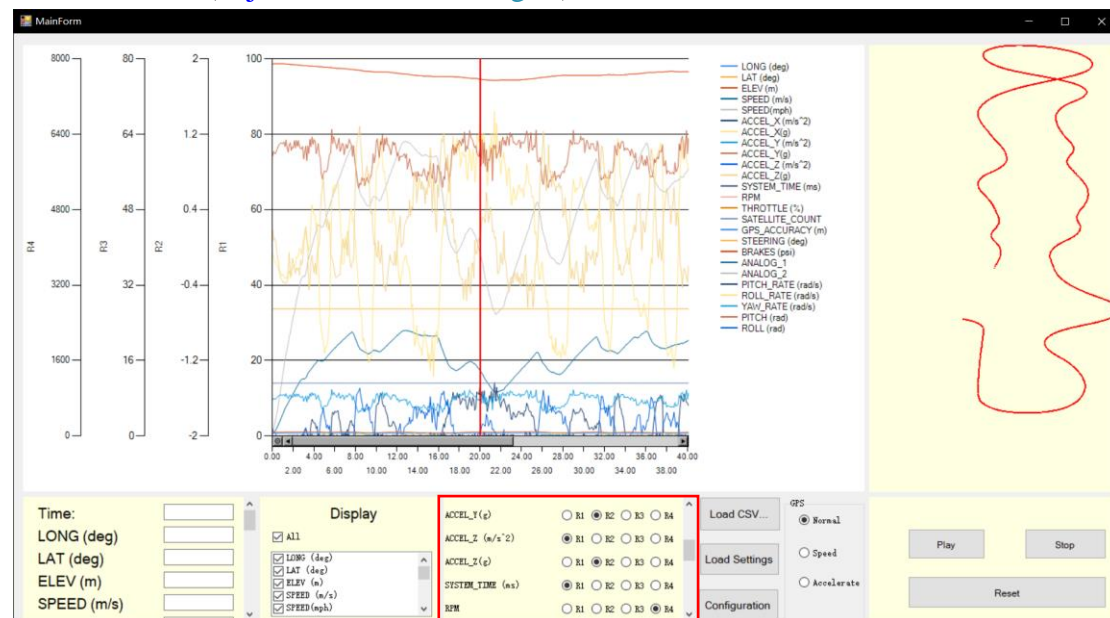

`void change(int no, ChartArea caR)`

`void rb1_Click(object sender, EventArgs e)`

`void rb2_Click(object sender, EventArgs e)`

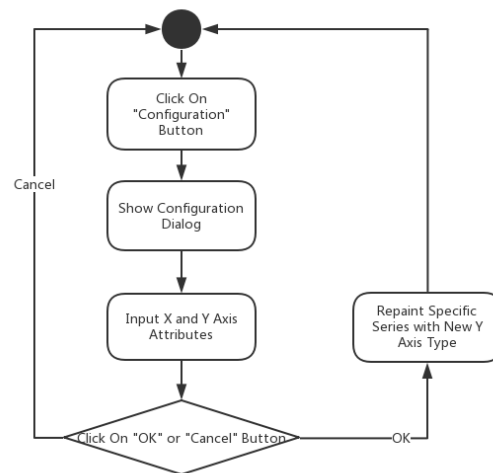

`void rb3_Click(object sender, EventArgs e)`

`void rb4_Click(object sender, EventArgs e)`

① Choose Different Y Types

## 2.5 Customize X axis and Y axis

Users could click on “Configuration” button to pop out a dialog for X axis and Y axis customization. Users could change the range of X axis range, scale and interval and Y axis range and type.

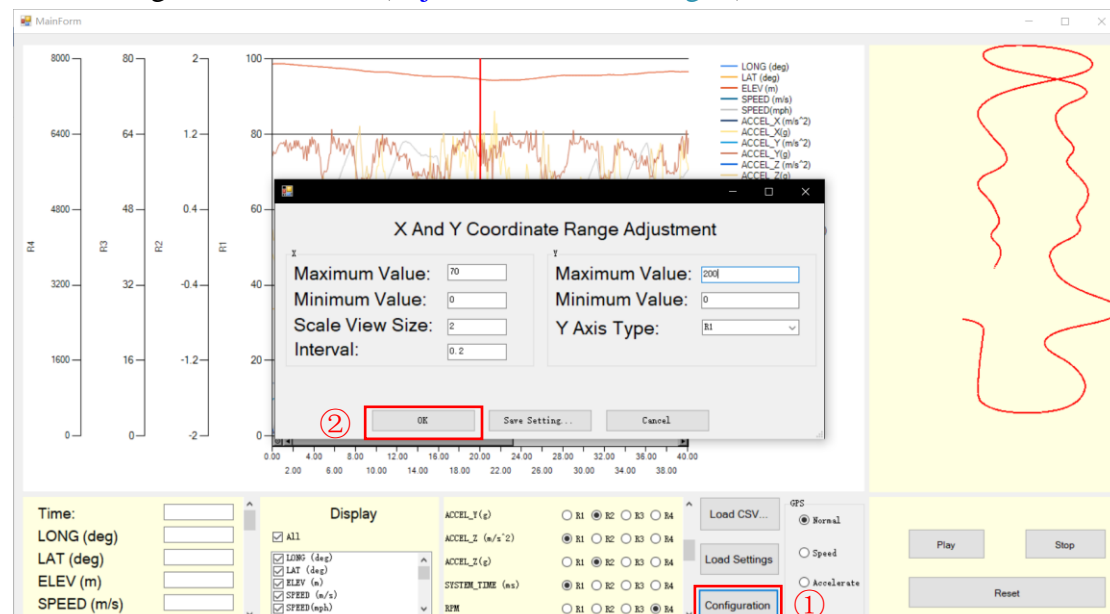

Related Functions and Forms:

`public partial class RangeForm : Form`

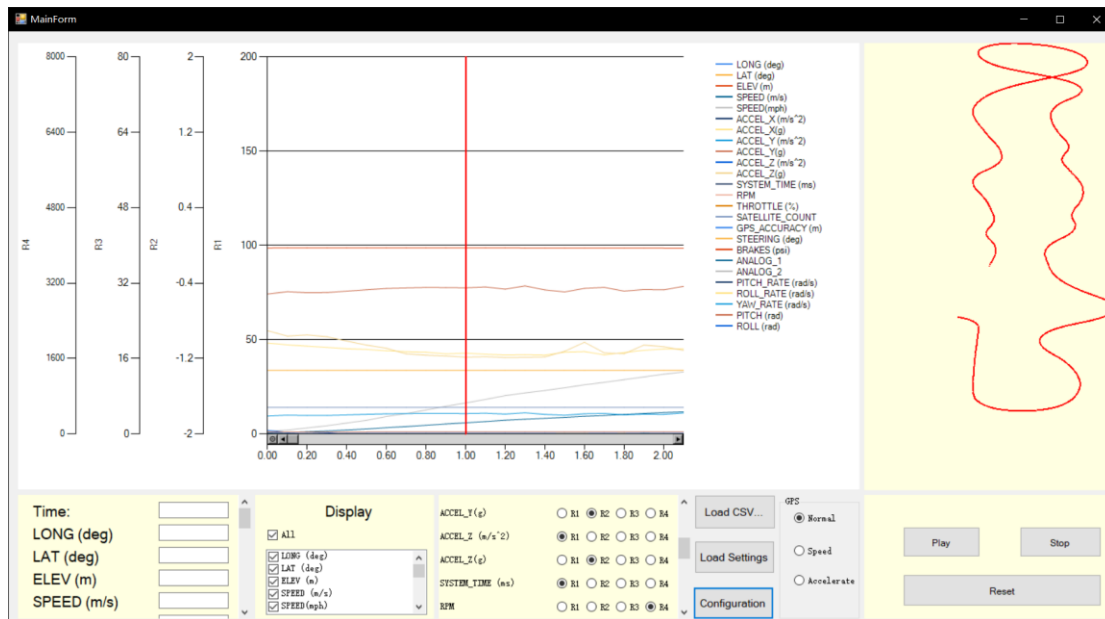

`void YRangeForm_Load(object sender, EventArgs e)`

`void confirmButton_Click(object sender, EventArgs e)`

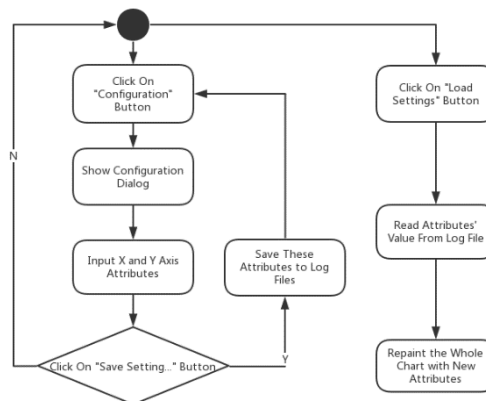

`void ConfigureButton_Click(object sender, EventArgs e)`

## 2.6 Save and Load Setting Log Files

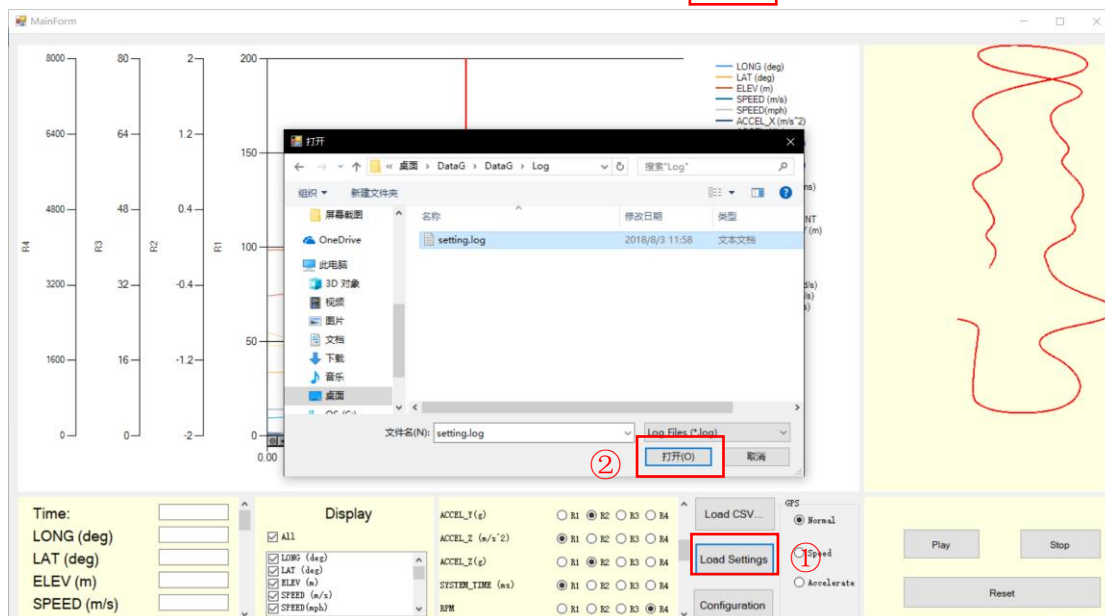

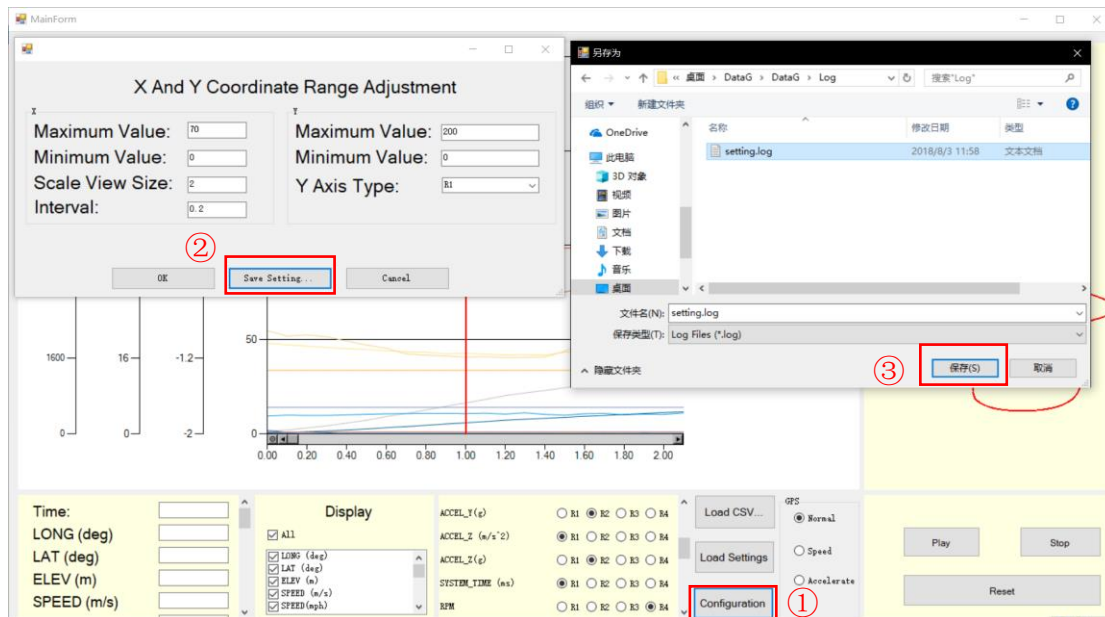

By clicking button of “Saving Setting...” in RangeForm, users could save log files with the X axis and Y axis configuration in specific form. Also, users could load log files created by them by clicking the button of “Loading Settings”.

Related Functions:

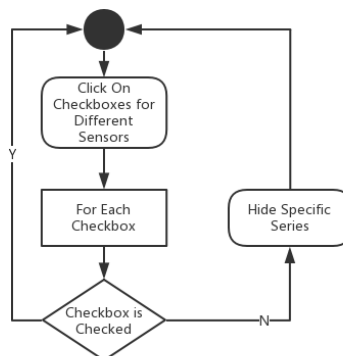

`void settingSaveButton_Click(object sender, EventArgs e)`

`void settingButton_Click(object sender, EventArgs e)`

## 2.7 Show or Hide Specific Series

Users could click on different checkboxes created dynamically by fileLoadingButton\_Click function. In addition, there is an allSelectedCheckBox for the selection of all.

Related Functions:

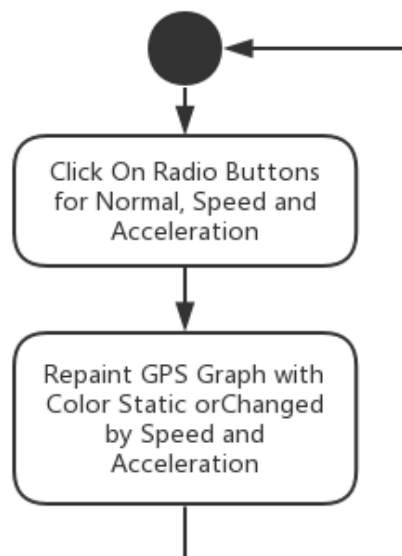

`void sensorCheckedListBox_ItemCheck(object sender, ItemCheckEventArgs e)`

`void allSelectedCheckBox_CheckedChanged(object sender, EventArgs e)`

①Click On Series Needed to be Show

## 2.8 Show Colored GPS Graph Changed by Speed or Acceleration

Users could click on “radioButton\_Normal” to show normal GPS graph, “radioButton\_Speed” to show GPS graph changed by speed where green represents high speed and red represents low speed and “radioButton\_Accelerate” to show GPS graph changed by acceleration.

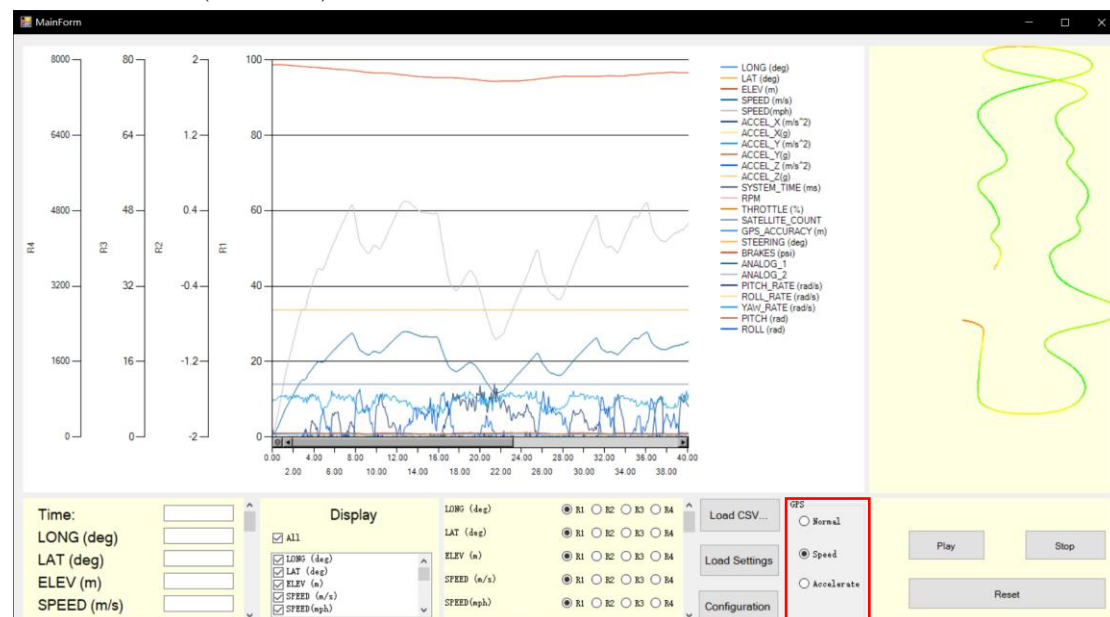

Related Functions:

`void radioButton_Normal_CheckedChanged(object sender, EventArgs e)`

```

void radioButton_Speed_CheckedChanged(object sender, EventArgs e)
void radioButton_Accelerate_CheckedChanged(object sender, EventArgs e)
int colorRed(double x)
int colorGreen(double x)

```

① Click On Normal, Speed or Accelerate Radio Button

## 2.9 Drag Mouse on the Chart

Users can drag the red line randomly in the chart. The chart will listen on “MouseDown” event to trigger “MouseMove” event and “MouseUp” event to end “MouseMove” event.

Related Functions:

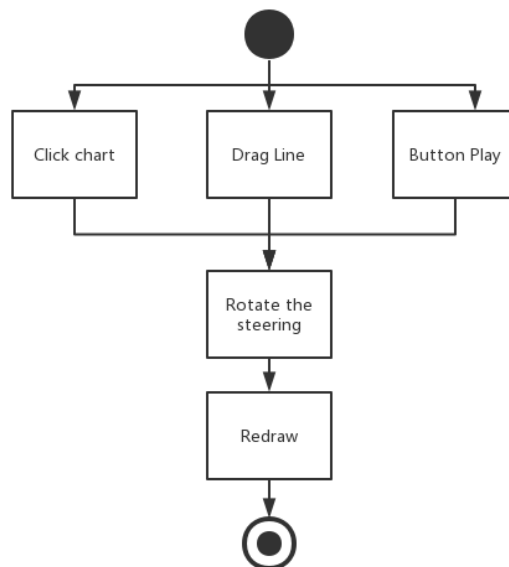

```

void sensorChart_MouseMove(object sender, MouseEventArgs e)

```

```
void sensorChart_MouseDown(object sender, MouseEventArgs e)
void sensorChart_MouseUp(object sender, MouseEventArgs e)
```

## 2.10 Show Steering Position

When user clicks on the chart, the steering wheel will be rotated a certain angle according to the CSV file. Similarly, if user clicks on Button Play, the angle of the steering wheel will be changed in real time.

Related Functions:

```
public static Image RotateImage(Image img, float rotationAngle);
private void sensorChart_MouseMove(object sender, MouseEventArgs e);
private void chartTimer_Tick(object sender, EventArgs e);
private void sensorChart_MouseClick(object sender, MouseEventArgs e);
```

## 3. Testing and Results

### 3.1 Testing Environment

- Visual Studio 2013&2015
- Programming Language: C#
